

# Liability Dollarization and Exchange Rate Pass-Through

---

Junhyong Kim (Korea Development Institute)

Annie Soyeon Lee (Johns Hopkins University)

- The dollar hit a two decade high in Sep 2022, appreciated by 16% since the beginning of 2022.

## Motivation: Strong Dollar & Spillover to Emerging Markets

- The dollar hit a two decade high in Sep 2022, appreciated by 16% since the beginning of 2022.
- The negative spillovers of strong dollar is particularly acute in emerging economies due to
  - (i) pass-through to domestic prices via large dependence on the **imported intermediate inputs**.
  - (ii) contractinoary effects of high level of **dollar-denominated corporate debt**.  
Krugman (1999), Céspedes, Chang and Velasco (2004) and Kim, Tesar and Zhang (2015)

## Motivation: Strong Dollar & Spillover to Emerging Markets

- The dollar hit a two decade high in Sep 2022, appreciated by 16% since the beginning of 2022.
- The negative spillovers of strong dollar is particularly acute in emerging economies due to
  - (i) pass-through to domestic prices via large dependence on the **imported intermediate inputs**.
  - (ii) contractinoary effects of high level of **dollar-denominated corporate debt**.  
Krugman (1999), Céspedes, Chang and Velasco (2004) and Kim, Tesar and Zhang (2015)
- The **negative balance sheet effect** of \$ debt on **domestic inflation** is neglected in the literature.

1. How do firms' pricing decisions vary with different levels of FC debt?
2. How significant is this balance sheet effect of FC debt in explaining the exchange rate pass-through to domestic producer inflation?

## Motivation: Domestic PPI Across Manufacturing Sectors in Korea

- From 1996-98, Realized PPI changes vs.  $\underbrace{\text{PPI changes implied via the imported input channel}}_{\text{Imported Input Share} \times \Delta \text{Imported Input Price}}$

assuming (i) Cobb-Douglas production function with CRTS, and (ii) a complete pass-through

- The imported input channel is in fall short of generating the level of PPI changes upon a large depreciation. ► Cross-country

# Motivation: Positive Correlation Between FC Debt Exposure and Residual PPI Changes

- Unexplained PPI changes and Pre-crisis Short-term FC debt exposure  
Realized PPI changes - Implied PPI Changes via Imported Input Channel

- Relatively neglected balance sheet channel may account for the much pronounced increase in domestic producer prices. [▶ Another Measure: Short-term FC Debt/Total Debt](#)

## Exchange Rate Pass-Through to Prices

- Exchange rate pass-through to domestic prices  
Goldberg, Campa (2010), Amiti, Itskhoki, Konings (2019)
- ⇒ Exploring the neglected **balance sheet channel** in the exchange rate pass-through to prices  
Ma, Schmidt-Eisenlohr (WP, 2023)

## Contractionary Effects of Foreign Currency Debt

- Empirical and theoretical investigation of negative balance sheet effects on firm performance  
Krugman (1999), Céspedes, Chang, Velasco (2004), Kim, Tesar, Zhang (2015), Kalemli-Ozcan, Kamil, Villegas-Sanchez (2016), Kohn, Leibovici, Szкуп (2018), Bruno and Shin (2023), Casas, Meleshchuk, Timmer (WP, 2023), Bruno, Shin(2023)
- ⇒ Balance sheet effects of foreign currency debt on **prices**

## Financial Frictions and Firms' Pricing Decisions

- Closed Economy Setting  
Gilchrist, Schoenle, Sim, Zakrajšek (2017), Christiano, Eichenbaum, Trabandt (2015), Del Negro, Giannoni, Schorfheide (2015), Kim (2021), Renkin, Züllig (2023)
- ⇒ **Open economy setting** in the sudden stop episodes with dollar debt and a large depreciation

(1) Exploiting **a large devaluation** in Korea in 1997, we identify the **balance sheet channel**

Industries with high ST FC debt exposure

(i)  $\uparrow$  their prices more during the crisis

Firms with high ST FC debt exposure

(ii)  $\downarrow$  sales growth,  $\downarrow$  networth growth and  $\downarrow$  **markup growth**

- (1) Exploiting **a large devaluation** in Korea in 1997, we identify the **balance sheet channel**

Industries with high ST FC debt exposure

- (i)  $\uparrow$  their prices more during the crisis

Firms with high ST FC debt exposure

- (ii)  $\downarrow$  sales growth,  $\downarrow$  networth growth and  $\downarrow$  **markup growth**

- (2) Build a **heterogeneous firm** model with two types of **financial constraints** and **imported inputs**

- (i) An industry equilibrium & its transition dynamics upon an **unexpected depreciation**

- (1) Exploiting **a large devaluation** in Korea in 1997, we identify the **balance sheet channel**

Industries with high ST FC debt exposure

- (i)  $\uparrow$  their prices more during the crisis

Firms with high ST FC debt exposure

- (ii)  $\downarrow$  sales growth,  $\downarrow$  networth growth and  $\downarrow$  **markup growth**

- (2) Build a **heterogeneous firm** model with two types of **financial constraints** and **imported inputs**

- (i) An industry equilibrium & its transition dynamics upon an **unexpected depreciation**

- (3) The estimated model performs quantitatively well in explaining sectoral price dynamics

- (4) A quantitatively sizable role of the balance sheet channel in explaining sectoral price dynamics

- (i) 15% to 30% of the sectoral price changes during the large depreciation period

## Empirical Analysis

---

- Our **unique dataset of firm-level B/S data + industry price data** has allowed the identification of the balance sheet channel

- Our **unique dataset of firm-level B/S data + industry price data** has allowed the identification of the balance sheet channel

### **Firm-level** balance sheet data: KISVALUE Dataset

1. **currency composition & maturity** of their debt:  
foreign currency vs. domestic currency, short-term vs. long-term [▶ Summary Stats](#)
2. not only large but small and medium-sized firms:  
 $\approx$  3,000 firms in manufacturing sector (as of 1996)
3. a rich set of firm-level variables to control for potential endogeneity bias:  
e.g., liquid assets in LC & in FC, sales & exports [▶ Corr](#)

- Our **unique dataset of firm-level B/S data + industry price data** has allowed the identification of the balance sheet channel

**Firm-level** balance sheet data: KISVALUE Dataset

1. **currency composition & maturity** of their debt:  
foreign currency vs. domestic currency, short-term vs. long-term [▶ Summary Stats](#)
2. not only large but small and medium-sized firms:  
≈ 3,000 firms in manufacturing sector (as of 1996)
3. a rich set of firm-level variables to control for potential endogeneity bias:  
e.g., liquid assets in LC & in FC, sales & exports [▶ Corr](#)

**Industry-level** price data: Bank of Korea

Domestic Produce Price Index (PPI) for 156 industries in manufacturing sector (4-digit).

Domestic Produce Price Index (PPI) for 156 industries in manufacturing sector (4-digit).

- ★ We exploit **a large devaluation** in Korea in 1997 & different **FC debt exposure** across industries to identify the balance sheet effect on the exchange rate pass-through to domestic output prices.

[▶ Won per \\$](#)

## What Makes 1996-1998 A Good Period for Identification?

- ★ We exploit a **large devaluation** in Korea in 1997 & different **FC debt exposure** across industries to identify the balance sheet effect on the exchange rate pass-through to domestic output prices.
- 

### 1. **Virtually no financial hedging**

- the exchange to trade financial derivatives to hedge FX risk was established in 1999

## What Makes 1996-1998 A Good Period for Identification?

- ★ We exploit a **large devaluation** in Korea in 1997 & different **FC debt exposure** across industries to identify the balance sheet effect on the exchange rate pass-through to domestic output prices.
- 

### 1. **Virtually no financial hedging**

- the exchange to trade financial derivatives to hedge FX risk was established in 1999

### 2. **Unexpectedness of devaluation**

*"Korea has strong fundamentals, unlike Latin American countries and Thailand; therefore, the probability of **Korea facing a currency crisis is abysmal** "*

*– BIS Chair, Alfons Verplaetse (Sept 1997)*

*"One of the most unusual aspects of the Asian crisis is the extent to which it was **unpredicted** by market participants and market analysts"*

*– Radelet and Sachs (2000)*

## What Makes 1996-1998 A Good Period for Identification?

*"One of the most unusual aspects of the Asian crisis is the extent to which it was **unpredicted** by market participants and market analysts"*

– Radelet and Sachs (2000)

### 3. **Lack** of regulation on FC borrowing

- no quantity regulation for both short-term and long-term FC debt
- forcing firms to reveal the purpose of the loan for long-term borrowing only

$$\Delta p_{i,96-98} = \beta_0 + \beta_1 \text{ST FC}_{i,96} + \beta_2 \text{LT FC}_{i,96} + \beta_3 X_{i,96} + \epsilon_i$$

- $\Delta p_{i,96-98}$ : the growth rates of PPI for industry  $i$  in 1996-98.

$$\Delta p_{i,96-98} = \beta_0 + \beta_1 \text{ST FC}_{i,96} + \beta_2 \text{LT FC}_{i,96} + \beta_3 X_{i,96} + \epsilon_i$$

- $\Delta p_{i,96-98}$ : the growth rates of PPI for industry  $i$  in 1996-98.
- $\text{ST FC}_i$ : weighted average of firms' short-term FC debt to total short-term debt ratio in industry  $i$ .
- $\text{LT FC}_i$ : weighted average of firms' long-term FC debt to total long-term debt ratio in industry  $i$ .

► correlation

$$\Delta p_{i,96-98} = \beta_0 + \beta_1 \text{ST FC}_{i,96} + \beta_2 \text{LT FC}_{i,96} + \beta_3 X_{i,96} + \epsilon_i$$

- $\Delta p_{i,96-98}$ : the growth rates of PPI for industry  $i$  in 1996-98.
- $\text{ST FC}_i$ : weighted average of firms' **short-term** FC debt to total short-term debt ratio in industry  $i$ .
- $\text{LT FC}_i$ : weighted average of firms' long-term FC debt to total long-term debt ratio in industry  $i$ .  

► correlation
- $X_i$  includes:
  - **Imported input** channel: imported intermediate input share
  - Other *industry-level* pass-through determinants: degree of the product differentiation (Rauch classification), degree of price stickiness
  - Weighted average of other **firm-level** variables: log of real sales, leverage ratio, short-term debt ratio, **export/sales ratio**, and FC cash/total current assets ratio
  - Broad **industry fixed effects** (two-digit)

## Empirics: Industry-Level Analysis

- Industries with high foreign currency exposure increase their prices more during the crisis.

$$\Delta p_{i,96-98} = \beta_0 + \beta_1 \text{ST FC}_{i,96} + \beta_2 \text{LT FC}_{i,96} + \beta_3 X_{i,96} + \epsilon_i$$

  - (ii) the industry-specific imported input share ( $\kappa$ )
- **Kimball aggregator** to examine variable mark-ups / strategic complementarity. ▶ Kimball
- Firms face two types of **financial** frictions.
- We assume that the economy is in the stationary equilibrium before **one-time unexpected** real exchange rate depreciation.
- We analyze the **transition dynamics** of industry price for each of 156 industries

## Technology: Entrepreneurs-Production

- Produces differentiated goods with domestic inputs  $n$ , foreign inputs  $x$  and capital  $k$ :

$$y = zk^{\alpha} x^{\kappa} n^{1-\alpha-\kappa}$$

- Need to save in liquid assets to pay a certain fraction  $(\frac{1}{\theta_a})$  of production costs before profits are realized:

$$wn + \xi x \leq \theta_a a$$

- Produces differentiated goods with domestic inputs  $n$ , foreign inputs  $x$  and capital  $k$ :

$$y = zk^{\alpha} x^{\kappa} n^{1-\alpha-\kappa}$$

- Need to save in liquid assets to pay a certain fraction  $(\frac{1}{\theta_a})$  of production costs before profits are realized:

$$wn + \xi x \leq \theta_a a$$

- $\xi$  is the real exchange rate, the price of foreign final goods in units of domestic final goods
  - **expect**  $\frac{\xi_t}{\xi_{t-1}} = 1$  for all  $t$

## Technology: Entrepreneurs-Production

- Produces differentiated goods with domestic inputs  $n$ , foreign inputs  $x$  and capital  $k$ :

$$y = zk^{\alpha} x^{\kappa} n^{1-\alpha-\kappa}$$

- Need to save in liquid assets to pay a certain fraction ( $\frac{1}{\theta_a}$ ) of production costs before profits are realized:

$$wn + \xi x \leq \theta_a a$$

- $\xi$  is the real exchange rate, the price of foreign final goods in units of domestic final goods
  - **expect**  $\frac{\xi_t}{\xi_{t-1}} = 1$  for all  $t$
- Invests in physical capital used in production and as a collateral:

$$k' = (1 - \delta)k + i$$

- Investment also subject to convex adjustment costs:

$$\Phi(k, k')$$

- Chooses to issue debt  $d'/(1+r)$  (in units of domestic final goods) and allocates **exogenously**:

- Chooses to issue debt  $d'/(1+r)$  (in units of domestic final goods) and allocates **exogenously**:
  - $(1-\lambda)\frac{d'}{1+r}$  to debt denominated in domestic final goods

- Chooses to issue debt  $d'/(1+r)$  (in units of domestic final goods) and allocates **exogenously**:
  - $(1-\lambda)\frac{d'}{1+r}$  to debt denominated in domestic final goods
  - $\lambda\frac{d'}{1+r}$  to debt denominated in foreign final goods (in units of **domestic** goods)
    - $\iff \lambda\frac{d'}{1+r}\frac{1}{\xi}$  to debt denominated in foreign final goods (in units of **foreign** goods)

- Chooses to issue debt  $d'/(1+r)$  (in units of domestic final goods) and allocates **exogenously**:
  - $(1-\lambda)\frac{d'}{1+r}$  to debt denominated in domestic final goods
  - $\lambda\frac{d'}{1+r}$  to debt denominated in foreign final goods (in units of **domestic** goods)
    - $\Longleftrightarrow \lambda\frac{d'}{1+r}\frac{1}{\xi}$  to debt denominated in foreign final goods (in units of **foreign** goods)
- In the beginning of next period, need to pay back in units of domestic goods

$$d'(1-\lambda) + \left(d'\lambda\frac{\xi'}{\xi}\right)$$

- Chooses to issue debt  $d'/(1+r)$  (in units of domestic final goods) and allocates **exogenously**:
  - $(1-\lambda)\frac{d'}{1+r}$  to debt denominated in domestic final goods
  - $\lambda\frac{d'}{1+r}$  to debt denominated in foreign final goods (in units of **domestic** goods)
    - $\iff \lambda\frac{d'}{1+r}\frac{1}{\xi}$  to debt denominated in foreign final goods (in units of **foreign** goods)
- In the beginning of next period, need to pay back in units of domestic goods

$$d'(1-\lambda) + \left(d'\lambda\frac{\xi'}{\xi}\right)$$

- Face borrowing constraints:

$$\frac{d'}{1+r} \leq \theta_k k'$$

## Model: Recursive Firm Problem

$$v(k, d, a, z; \lambda, \kappa, \xi) = \max_{c \geq 0, d', k', a', n, x, p} \frac{c^{1-\gamma}}{1-\gamma} + \beta E_{z'}[v(k', d', a', z'; \lambda, \kappa, \xi')]$$

$$s.t. \quad c + k' - (1 - \delta)k + \Phi(k, k') + a' + d((1 - \lambda) + \underbrace{\lambda \frac{\xi}{\xi_{-1}}}_{=1}) = \underbrace{py - wn - \xi x}_{\pi(k, z)} + a + \frac{d'}{1+r}$$

$$\frac{1}{1+r}d' \leq \theta_k k' \quad \{\eta_1\}, \quad wn + \xi x \leq \theta_a a \quad \{\eta_2\},$$

where

$$(i) \ y = \left(1 - \epsilon \ln\left(\frac{p}{P_I}\right)\right)^{\sigma/\epsilon} P_I^{-\nu}$$

$$(ii) \ y = zk^{\alpha} x^{\kappa} n^{1-\alpha-\kappa}, \quad (iii) \ \Phi(k, k') = \frac{\phi}{2} \left(\frac{k' - (1 - \delta)k}{k}\right)^2 k$$

- Firm  $j$ 's optimal pricing decision is

$$p_{j,t} = \underbrace{\mu_{j,t} mc_{j,t}}_{\uparrow \text{ tighter working capital constraints}} (1 + \eta_{2,j,t})$$

- Balance sheet deterioration has an effect on price by

## (i) Investment adjustment

Balance sheet deterioration  $\Rightarrow \downarrow$  Investment( $k_{j,t+1}$ )  $\Rightarrow \downarrow$  productivity  $\Rightarrow \uparrow mc_{j,t+1}$

- Firm  $j$ 's optimal pricing decision is

$$p_{j,t} = \underbrace{\mu_{j,t} mc_{j,t}}_{\uparrow \text{ tighter working capital constraints}} (1 + \eta_{2,j,t})$$

- Balance sheet deterioration has an effect on price by

### (i) Investment adjustment

Balance sheet deterioration  $\Rightarrow \downarrow$  Investment( $k_{j,t+1}$ )  $\Rightarrow \downarrow$  productivity  $\Rightarrow \uparrow mc_{j,t+1}$

### (ii) Working-capital channel

Balance sheet deterioration  $\Rightarrow \downarrow$  Cash( $a_{j,t+1}$ )  $\Rightarrow \uparrow \eta_{2,j,t+1}$

- Firm  $j$ 's optimal pricing decision is

$$p_{j,t} = \underbrace{\mu_{j,t} mc_{j,t}}_{\uparrow \text{ tighter working capital constraints}} (1 + \eta_{2,j,t})$$

- Balance sheet deterioration has an effect on price by

## (i) Investment adjustment

Balance sheet deterioration  $\Rightarrow \downarrow$  Investment( $k_{j,t+1}$ )  $\Rightarrow \downarrow$  productivity  $\Rightarrow \uparrow mc_{j,t+1}$

## (ii) Working-capital channel

Balance sheet deterioration  $\Rightarrow \downarrow$  Cash( $a_{j,t+1}$ )  $\Rightarrow \uparrow \eta_{2,j,t+1}$

- Strategic Complementarity** allows additional channel via the adjustment of  $\mu_{j,t+1}$

## Policy Function of $p''$ Against $d$ and $k$

- Firms charge higher  $p \uparrow$  with lower  $k$ , higher  $d$  and higher  $\lambda$ .
- Strategic complementarity pushing up the policy function even with zero FC debt  $\lambda$ .

## Policy Function of $\mu''$

- Firms lower their markups  $\mu \downarrow$  with lower  $k$ , higher  $d$  and higher  $\lambda$  upon  $\uparrow$  effective MC
  - Relatively better off firms with higher  $k$  and lower  $d$  increase their markups  $\mu \uparrow$ .
- Strategic complementarity pushing up the policy function even with zero FC debt  $\lambda$ .

## Quantitative Analysis

Parameter	Value	Description	Targeted Moments
$\beta$	0.9101	Time discount factor	Mean of Debt to Sales Ratio (0.66)
$\theta_k$	0.7114	Fraction of capital as a collateral	Std of Debt to Sales Ratio (0.26)
$\theta_a$	1.3812	Fraction of working capital	Mean of Cash to Sales ratio (0.44)

- Each industry with its specific firm-level distribution of  $\lambda$  and the imported input share  $\kappa$  has different stationary equilibrium and different transition dynamics upon **one time unexpected depreciation** of the real exchange rate.
  - period 0 : stationary equilibrium (SS)
  - period 1 : unexpected depreciation of real exchange rate (MIT shock)  
 $\Rightarrow k'$  and  $a'$  change
  - ...
  - period  $\infty$ : new stationary equilibrium (SS)
- We investigate the transition dynamics when  $\xi$  goes up from 1 to 2.1 in the first period and stays there afterwards for each of 156 industries

## Industry-Level Analysis

- Industry price dynamics upon **unexpected** large depreciation at period 1
- Industries with imported input share = 0.13

## Model: Industry-Level Analysis

- Marginal Effect of FC Short-term Debt Ratio on Price Changes in Crisis (Data vs. Model)

► Residual PPI: Model

$$\Delta p_{I,0-2} = \beta_0 + \beta_1 \text{ ST FC}_{I,0} + \beta_2 \text{ Imported Input Share}_I + \epsilon_I$$

	Data	Model
ST FC	0.5685 (0.2038)	0.2112
Imported Input Share	0.2830 (0.1656)	0.7346
$R^2$	0.4513	0.9968
N	156	156

- The model can explain more than half of the variation in price changes across industries.

	Data	Model
Std of $\Delta p_{I,0-2}$	0.1830	0.1004

$$\Delta p_j = \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_j + \beta_3 \Delta P_I + \beta_4 \mathbf{1}_{\text{Unconstrained},j} + \beta_5 \text{ST FC}_j \times \mathbf{1}_{\text{Unconstrained},j} + \epsilon_j$$

$$\begin{aligned} \Delta p_j = & \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_j + \beta_3 \Delta P_I + \beta_4 \log(k_j) + \beta_5 \text{ST FC}_j \times \log(k_j) \\ & + \beta_5 \log(d_j) + \beta_6 \text{ST FC}_j \times \log(d_j) + \epsilon_j \end{aligned}$$

## Firm-level Regression: Price Changes

$$\Delta p_j = \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_j + \beta_3 \Delta P_I + \beta_4 \mathbf{1}_{\text{Unconstrained},j} + \beta_5 \text{ST FC}_j \times \mathbf{1}_{\text{Unconstrained},j} + \epsilon_j$$

$$\Delta p_j = \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_j + \beta_3 \Delta P_I + \beta_4 \log(k_j) + \beta_5 \text{ST FC}_j \times \log(k_j) + \beta_6 \log(d_j) + \beta_7 \text{ST FC}_j \times \log(d_j) + \epsilon_j$$

	Price Changes		
ST FC <sub>j</sub>	0.0724	0.0801	0.1483
Imported Input Share <sub>j</sub>	0.2300	0.2385	0.2926

1 <sub>Unconstrained,j</sub> × ST FC <sub>j</sub>		-0.0464	
log(k <sub>j</sub> ) × ST FC <sub>j</sub>			-0.0053
log(d <sub>j</sub> ) × ST FC <sub>j</sub>			0.0548

► Price: log(a+k)

## Firm-level Regression: Markup Changes

$$\Delta\mu_j = \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_l + \beta_3 \Delta P_l + \beta_4 1_{\text{Unconstrained},j} + \beta_5 \text{ST FC}_j \times 1_{\text{Unconstrained},j} + \epsilon_j$$

$$\Delta\mu_j = \beta_0 + \beta_1 \text{ST FC}_j + \beta_2 \text{Imported Input Share}_l + \beta_3 \Delta P_l + \beta_4 \log(k_j) + \beta_5 \text{ST FC}_j \times \log(k_j) \\ + \beta_6 \log(d_j) + \beta_7 \text{ST FC}_j \times \log(d_j) + \epsilon_j$$

	Markup Changes		
ST FC <sub>j</sub>	-0.0609	-0.0677	-0.1214
Imported Input Share <sub>l</sub>	-0.1913	-0.1994	-0.2415
ΔP <sub>l</sub>	0.2656	0.2728	0.2993
1 <sub>Unconstrained,j</sub> × ST FC <sub>j</sub>		0.0413	
log(k <sub>j</sub> ) × ST FC <sub>j</sub>			0.01
log(d <sub>j</sub> ) × ST FC <sub>j</sub>			-0.05

## Quantitative Size of the Balance Sheet Channel (Industry-level Direct + Indirect effect)

- Compare the **baseline results** with **counterfactual outcomes** where the imported input price stays constant upon a depreciation shock.

## Quantitative Size of the Balance Sheet Channel (Industry-level Direct + Indirect effect)

- Compare the **baseline results** with **counterfactual outcomes** where the imported input price stays constant upon a depreciation shock.
- Across FC debt share deciles, the balance sheet channel explains a substantial share of the simulated **industry-level** price changes.

- We find empirically that **industries with higher foreign currency debt increased their prices more** during the large devaluation period.
- With the model-generated data, we decompose the **two distinct channels of exchange rate pass-through** – **balance sheet channel** and **imported input channel** and show that both are significant contributors to the firm-level price dynamics during the crisis.
- Our empirical analysis and our quantitative analysis reveal that it is important, albeit overlooked, to incorporate **the balance sheet effect** when analyzing how **the exchange rate affects domestic prices**, especially for *emerging economies with dollarized liability*.

**Thank you! :)**

## Motivation: Cross-Country

- Realized PPI change vs. Imported input implied PPI change

	Crisis Year	$\Delta$ Import Price Index	Imported Input Share (%)	$\Delta$ MC Due to Import Price Changes Implied PPI Changes via Imported Input*	$\Delta$ PPI (%)
Brazil	1999	64.08	6.0	3.84	33.0
Mexico	1994	165.39	13.2	21.87	47.11
Korea	1997	40.37	14.6	6.05	16.46
Thailand	1997	20.09	22.0	4.43	17.89
Argentina	2002	169.87	6.1	10.39	122.22

The country sample is identical to Burstein, Eichenbaum and Rebelo (2005).

The imported input share is  $\frac{\text{imported intermediate input}}{\text{total input}}$

We assume a complete exchange rate pass-through.

## Mark-up Measure: De Locker and Warzynski (2011)

- Assume that producer  $j$  is a cost minimizer:

$$\min C_{jt} = \sum_{v=1}^n \underbrace{p_{jt}^v x_{jt}^v}_{\text{variable input costs}} + \underbrace{r_{jt} k_{jt}}_{\text{cost of capital}} + \lambda_{jt} (Q_{jt} - \underbrace{F(x_{jt}^1, \dots, x_{jt}^n, k_{jt})}_{\text{production function}})$$

- FOC w.r.t a variable input  $x_{jt}^v$  :

$$\underbrace{\frac{\partial F(\cdot)}{\partial x_{jt}^i} \frac{x_{jt}^v}{Q_{jt}}}_{\text{output elasticity: } \theta_{jt}^v} = \frac{1}{\lambda_{jt}} \frac{p_{jt}^v x_{jt}^v}{q_{jt}} \quad \text{where } \lambda_{jt} = \frac{\partial C_{jt}}{\partial Q_{jt}}$$

- Hence, mark-up is:

$$\mu_{jt} = \frac{P_{jt}}{\lambda_{jt}} = \theta_{jt}^v \times \frac{P_{jt} Q_{jt}}{p_{jt}^v x_{jt}^v}$$

- Change in mark-up, assuming the output elasticity is constant over time:

$$\Delta \log \mu_{jt} = \Delta \log \frac{P_{jt} Q_{jt}}{p_{jt}^v x_{jt}^v}$$

► back

- Firms with high foreign currency debt exposure have lower investment growth, lower labor productivity growth and lower employment growth during the crisis.

## Preferences: Kimball-CES Structure

- Each industry  $I$  faces an exogenous CES demand, where the demand for industry  $I$ 's composite goods is given by:

$$Y_I = \frac{P_I^{-\nu}}{\bar{P}} \bar{Y}$$

- Each industry  $I$  is populated by a continuum of entrepreneurs indexed by  $j(I)$ .
- Intermediate goods**,  $y_j$ , are produced by entrepreneurs  $j$ , aggregated into industry  $I$ 's composite goods by the Kimball (1995) aggregation.
- Following Gopinath and Itskhoki (2010), we assume functional forms and the demand for an intermediate good produced by an entrepreneur  $j$  is:

$$y_j = \left(1 - \epsilon \ln\left(\frac{p_j}{P_I}\right)\right)^{\sigma/\epsilon} Y_I, \quad p_j = \exp\left(\frac{1}{\epsilon} \left(1 - \left(\frac{y_j}{Y_I}\right)^{\epsilon/\sigma}\right)\right) P_I$$

## Policy Function of $k'$ : (i) Investment adjustment

- With high enough debt  $d$ , the borrowing constraint starts binding, lowering investment  $k'$
- With lower  $k$ , next-period capital  $k' \downarrow$
- With higher FC debt  $\lambda$ , investment  $k' \downarrow$

## Policy Function of $\eta_2$ : (ii) Working-capital channel

$$\beta r E_{z'|z}[(c')^{-\gamma}] + \underbrace{\eta_1}_{\text{more binding collateral constraints } \uparrow} = \beta \theta_a E_{z'|z}[\eta'_2]$$

- The working capital constraints are more binding  $\eta_2 \uparrow$  with lower  $k$ , higher  $d$  and higher  $\lambda$

## Policy Function of $a'$ : (ii) Working-capital channel
